Congenital cleft forearm complex

Markus Pääkkönen 1, Max Mann 2, Wiebke Hülsemann 2

1. Department of Pediatric Orthopaedics and the Clinic of Hand and Upper Limb Surgery, Turku University Hospital, Turku, Finland.
2. Department of Pediatric Hand Surgery, Catholic, Children’s Hospital Wilhelmsstift, Hamburg, Germany.

No family history of upper limb anomalies

Larger forearm (radial)
- an active motion of 60-100°

Less developed ulnar forearm
- no useful function
- ulnohumeral synostosis

Resection of the ulnar part was recommended.

Forearm cleavage has not been previously described in the literature

We recommend the category “congenital cleft forearm” to be added to the Oberg-Manske-Tonkin classification

X-ray of the right upper limb

8-month old infant with congenital forearm cleavage
